Many applications require surfaces that are highly reflective, and the most common technique for making mirrored surfaces is to vacuum deposit a reflective coating onto a polished surface. At Newport

maximum performance in the UV to infrared regions.

Key Benefits:

- High reflectance over a broad range
- Reasonable durability
- Can be designed to perform well for a wide range of applications (e.g., wide wavelength ranges, high angles, etc.)
- Low cost

High Reflector

Newport Thin Film Laboratory has extensive experience in the manufacture of high reflection coatings for ultraviolet, visible and infrared applications. The highest overall reflectance ($R > 99.9\%$) can be achieved with relatively narrow band dielectric reflectors which can be optimized for any given performance band. However, very high reflectors can be manufactured for almost any application, including multiple bands and wide bands.
