

# Lasers

Easiest Integration. Stand-alone operation with internal PC and built in user I/O. Fastest start up available.

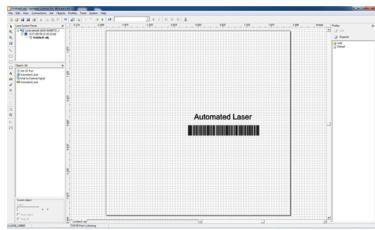

## **AUTOLASE CSG2-30 30-WATT CO<sub>2</sub> LASER**

Our latest generation turnkey CO<sub>2</sub> laser marking system is loaded with new features and improvements.

Automated Laser's marking systems continue to lead the industry offering higher resolution, more flexibility, and enhanced processing capabilities.

The AutoLase CSG2-30, our most popular laser marker, is a 30-watt turnkey CO<sub>2</sub> laser marking system. CO<sub>2</sub> lasers have been used for years due to their versatility and cost-effective price. CO<sub>2</sub> marks a wide variety of materials it is capable of producing both engraved, raised, and contrasting marks; it is one of the most

WinLase Operating Software

affordable laser platforms in use today. Because it is self-contained, you need little more than a standard 120-volt power cord to run the AutoLase CSG2-30.

#### New Features

We incorporated several new features into the CSG2-30 that make integration into your existing process much easier. The new user I/O, allows the AutoLase CSG2-30 to stand on its own without needing an additional PLC or PC to control it. You can easily connect the standard 4-In / 4-Out I/O ports to sensors, solenoid valves, step motors or other devices thus allowing the CSG2-30 to act as its own cell controller. With our latest upgrades you can easily setup the AutoLase CSG2-30 to mark on multiple sides of a component, mark on the entire circumference of circular parts, perform simple inspection prior to marking, or even control a simple assembly process if desired.

It is easy to integrate the CSG2-30 into a PLC or PC based system because the I/O is user configurable for either NPN or PNP signals. We consider the CSG2-30 to be the finest, the easiest, and the fastest laser system to integrate into your process. With every AutoLase laser system, we include a user-friendly Graphical User Interface (GUI). Customers find that setup of the CSG2-30 takes just a matter of minutes before they are marking their first part.

With our optional Mark-on-the-fly feature, you can use a low-cost rotary or linear encoder to monitor your process for changing speeds and still maintain a quality mark. When marking parts on conveyors, index dials, or

moving transports, speed changes are not a problem for the CSG2-30.

## Configurations

We offer the AutoLase CSG2-30 in three different configurations: CSG2-30-0, CSG2-30-1, and CSG2-30-2 in order meet your requirements. See below for a short explanation of the features included with each level.

#### CSG2-30-0

- Simple I/O interface that allows digital handshaking with a PLC or other controller to start a mark sequence
  - Signals include System Enabled, Ready to Mark, Mark In Process, Start Mark
- Serial or Ethernet Communications that allow remote job selection or changes to the mark profile

#### CSG2-30-1

- Includes All the features of the CSG2-30-0 model.
- User I/O for simple cell control
- Up to 16 job profiles can be stored and remotely selected through the user I/O Standalone mode allowing the internal PC and hard dive to be turned off.

#### CSG2-30-2

- All the features of the CSG2-30-0 and the CSG2-30-1 models
- Mark on the fly

#### Feature

### Benefit

- Simple
   automation
   interface to
   control systems
   (user selectable
   NPN or PNP,
   Opto-isolated)
   with built-in I/O
   capabilities.
- This gives you the flexibility to connect the AutoLase CSG2-30 to a variety of control systems without the need for special software or interface boards. All in one neat package.

- Built in safety redundancy easily interfaces with standard industrial systems.
- Provides operator security, the laser will not operate without the required safeties in place and activated.
- Ability to integrate as a standalone controller for external device control.
- Provides you with the capability for the laser to act as a standalone device controlling solenoid valves or simple motors with its user I/O.
- Streaming mode offers real time control by Ethernet or serial
- Unlike competitive models,
   AutoLase's streaming mode
   provides additional flexibility by
   allowing you to choose the
   control method that works best

commands. for your application, speeding up

the installation and setup time.

# Latest Updates:

- Resolution Increased to 20 bit for higher marking precision
- Dramatically increased marking processer speed, now 3 times faster than previous models
- 265 MB built-in RAM
- Increased max laser frequency to 20 MHz
- Increased onboard storage for marking jobs to 512
   MB
- User I/O for up to 4IN/4OUT

## Specifications:

Mark Area approx. 4" (101.6 mm) Square

Lines of Text 1-300 \*

Text Size 0.01" (.254 mm) and up Mark Speed 400 Characters per Second

Focal Length 6" (152.4 mm) Input Volts / Amps 120VAC / 15A

Cooling Internally Fan Cooled

Trigger Program, Keyboard, External

MIP/Fault Yes
