Model 262 Reflectometer

\$2,995.00

The Model 262 Reflectometer was developed for the *Bright Plating* industry to measure reflectance at various locations on a spun aluminum curved

surface for streetlight and other reflectors. This compact desktop instrument is easy to use and simple to calibrate thereby providing production people with a rapid means to assure quality of the reflectors being processed.

Product Description

The Model 262 Reflectometer was developed for the *Bright Plating* industry to measure reflectance at various locations on a spun aluminum curved surface for streetlight and other reflectors. This compact desktop instrument is easy to use and simple to calibrate thereby providing production people with a rapid means to assure quality of the reflectors being processed.

The instrument is calibrated with an on-board reflectance standard. Measurements are made by touching a soft probe to the surface being measured. The reflectance displays immediately on a 3 1/2 digit bright red digital meter. The soft probe is connected to the instrument by fiber optics. Most reflectors are used to illuminate an area to improve visibility at night for the eye. Thus, the reflectometer has similar spectral (photopic) response as the eye.

The illumination source is a white light LED that is electronically chopped (with no moving parts) and synchronously demodulated to provide a system that is not affected by room light.

The Model 262 is available in the following configurations:

Model	Configuration
262	Reflectometer (single channel)
262(5)	5-Channel Reflectometer
262T	Transmissometer (single channel)
262D	Diffuse Transmissometer
262T/R	Reflectometer & Transmissometer

These modestly priced instruments have been provided to a number of plating facilities in the continental United States and overseas. Call, write, FAX or **email** for additional technical information, specifications, or price quotation.
