

QBU series Pockels cell driver

User manual

Warning! This equipment produces high voltages that can be very dangerous.
Please read user manual before starting operations.

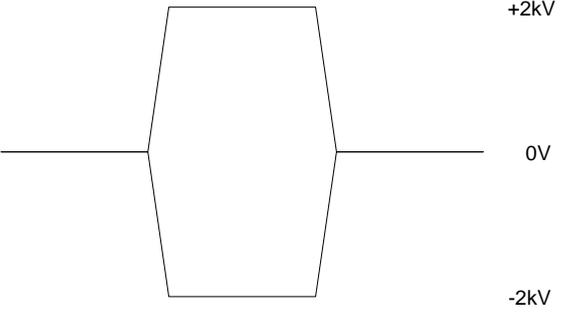

Important note: please measure the output with symmetrical (differential) high voltage probe only. Measurement made with inappropriate equipment is a common cause of driver's failure.

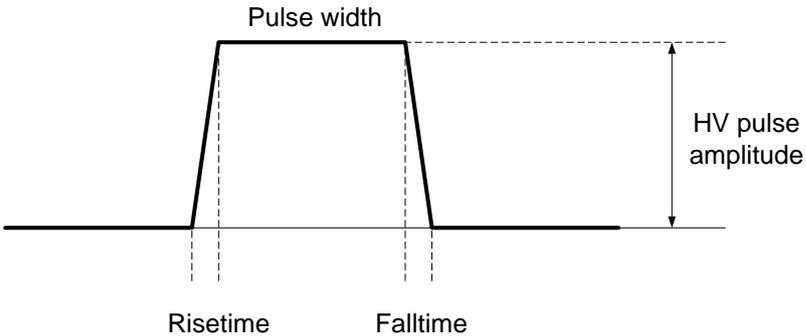

Overview

QBU series Pockels cell drivers produce high voltage pulses with high repetition rates, fast risetimes and falltimes, adjustable voltage amplitude and pulse width. Two control types are available: manual and automatic

Pulse parameters

<p>Module produces bipolar output. It means that 4kV pulse is physically formed by applying +2kV to positive output wire and -2kV to negative</p>	
---	--

Attention! Further description of HV output will be given in terms of voltage differences. Please keep it in mind!

<p>Typical pulse shape</p>	
<p>Risetime / Falltime</p>	<p><15ns (about 10ns typ.)^{1, 2}</p>
<p>Pulse width</p>	<p>from 200ns to DC</p>
<p>HV pulse amplitude</p>	<p>from HV_{MIN} to HV_{MAX}³</p>
<p>Repetition rates</p>	<p>from single shot to ~50kHz (continuously)^{2, 4}, to ~100kHz (short-term)^{2, 4}</p>
<p>Internal timing⁵</p>	<p>~100us</p>

¹ at 10-90% level

² depends on HV pulse amplitude and load capacitance

³ HV_{MIN} and HV_{MAX} values see in How to order? section

⁴ depends on working mode and cooling conditions

⁵ see description below

Internal timing

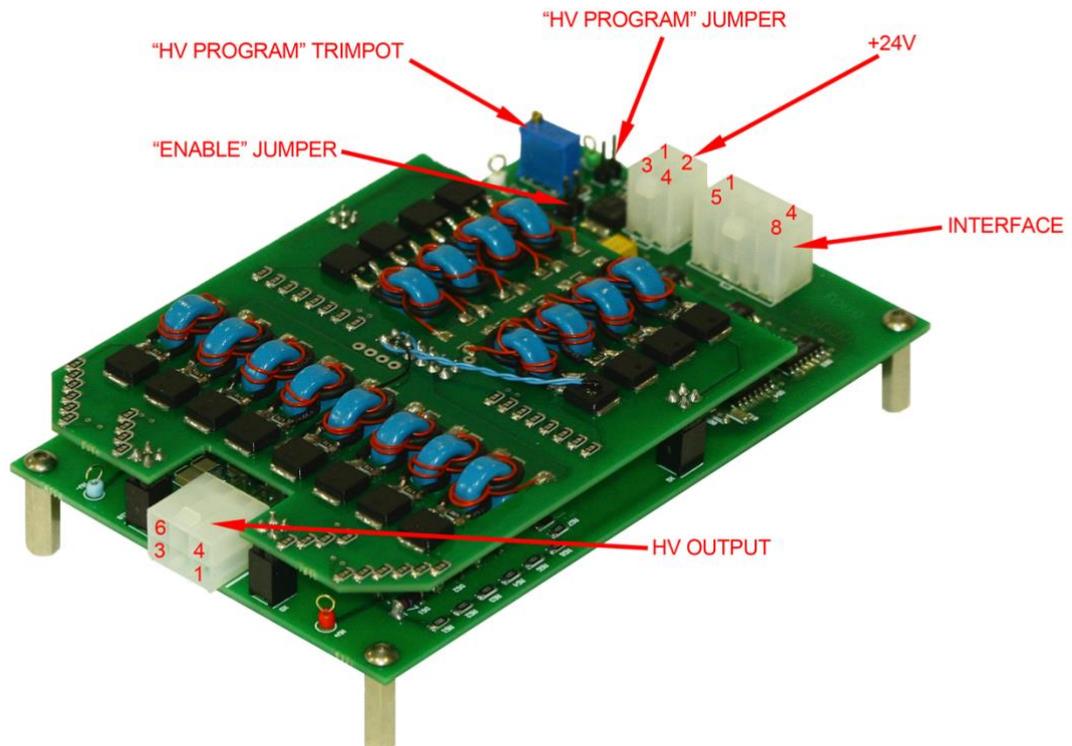

Without Q-switch signal is switched driver maintains its state. Internal timer continuously refreshes driver condition every $\sim 100\mu\text{s}$. It is cause of:

1. HV output levels have small ripple with period $\sim 100\mu\text{s}$
2. It's prohibited to trigger HV output level as internal timing is occurring.
Therefore triggering of HV output is sometimes (very rarely) skipped.

Cooling

At middle and high operation frequencies (more than 5-10kHz) forced air cooling is required. The driver has internal protection from overheating – it automatically shuts down at $\sim 70\text{C}$

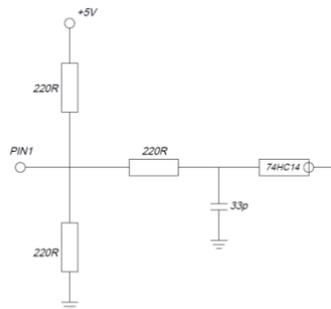

Connections, signals, signal descriptions

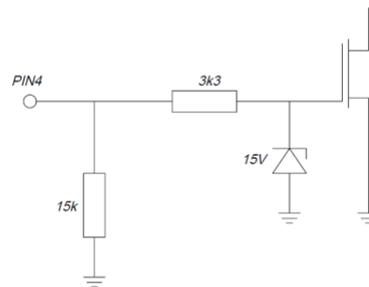

There are three connectors at Pockels cell “driver” board. Hereafter is description of corresponded female connectors (supplied with the board)

INTERFACE CIRCUITS

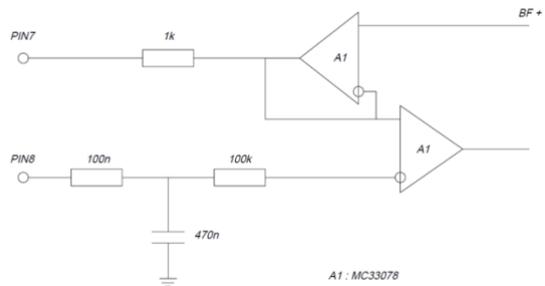

Q-Switch

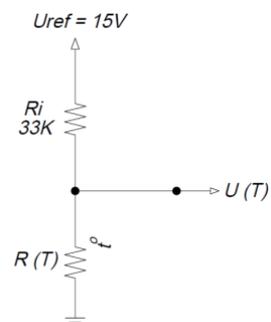

Enable

HV Program and
HV Monitor

Temp Monitor

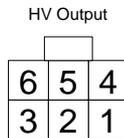

+24V (Molex 39-30-1040):

PIN (color)	DESIGNATION	DESCRIPTION
1, 2 (red)	+24V	INPUT positive 24VDC for turn on the Pockels cell driver
3, 4 (black)	RETURN	Return from power supply producing +24VDC

HV OUTPUT (Molex 39-30-1060):

PIN (color)	DESIGNATION	DESCRIPTION
1, 4 (red)	Positive	HV Positive
2, 5	N/C	
3, 6 (blue)	Negative	HV Negative

“ENABLE” JUMPER:

Use “*ENABLE*” *JUMPER* instead of “*ENABLE*” *PIN4* of *INTERFACE*. Don’t use “*ENABLE*” *JUMPER* and “*ENABLE*” *PIN* at the same time.

“HV PROGRAM” JUMPER AND “HV PROGRAM” TRIMPOT:

Use “*HV PROGRAM*” *JUMPER* instead of “*HV PROGRAM*” *PIN8* of *INTERFACE*. If jumper is on it sets output voltage according to “*HV PROGRAM*” *TRIMPOT* state.

Don’t use “*HV PROGRAM*” *JUMPER* and “*HV PROGRAM*” *PIN* at the same time.

Safety

Warning! This equipment produces high voltages that can be very dangerous. Don't be careless around this equipment.

- To provide safety the QBU-series Pockels cell driver module is designed to be powered with supply voltage +24VDC, which must be galvanically separated from mains.
- It is the user's responsibility to ensure that personnel are prevented from accidentally contacting the QBU-series Pockels cell driver module, especially the high voltage connector and cable. **Casual contact could be fatal.** Output cables must have good isolation for output voltage and low capacitance.
- After shut down, do not touch the load until it has been discharged. Use an appropriate measurement device to check for complete discharge.
- Disconnect the QBU-series Pockels cell driver module from DC power supply before changing electrical or mechanical connections.

Operations (Manual control)

1. Connect +24VDC power supply, pulse generator and Pockels cell
2. Set up "*HV PROGRAM*" *JUMPER*
3. Turn on +24VDC power supply
4. Set up "*ENABLE*" *JUMPER*
5. Use "*HV PROGRAM*" *TRIMPOT* to set up required output voltage
6. Send driving pulses from pulse generator to *PINI* of *INTERFACE*.
Set both pulse length and distance between pulses not less than 1us
7. To power down the driver, turn off +24VDC power supply or remove "*ENABLE*" *JUMPER*

Operations (Automatic control)

1. Connect +24V, *INTERFACE* and *HV OUTPUT* connectors to the board.
2. Remove "*HV PROGRAM*" *JUMPER*, remove "*ENABLE*" *JUMPER*
3. *DISABLE* the high voltage output
4. Apply the correct nominal *DC INPUT* power to the module
5. Set up the required output voltage by applying a DC voltage to the *HV PROGRAM PIN8* of *INTERFACE*
6. *ENABLE* the high voltage output
7. Send driving pulses to *PINI* of *INTERFACE*.
Too short pulses will be processed as 200ns pulses
8. To power down the driver, remove *DC INPUT* power or *DISABLE* high voltage output

Measure the output voltage

Important note: please measure the output with symmetrical (differential) high voltage probe only. Measurement made with inappropriate equipment is a common cause of driver's failure.

Specification

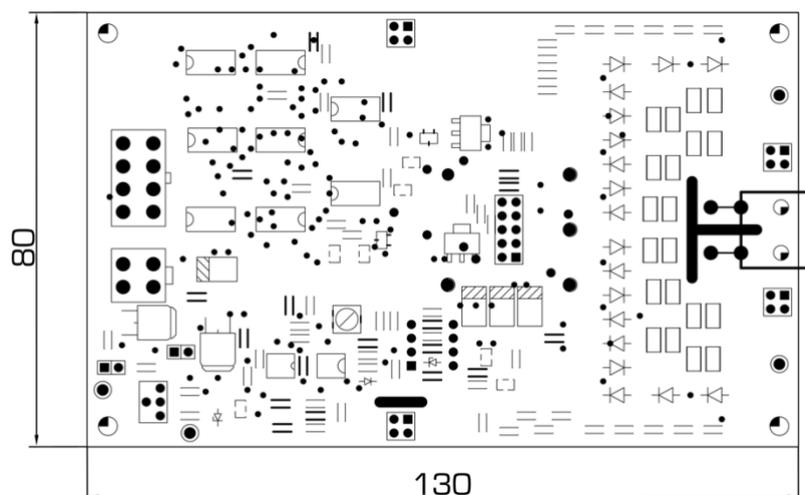

ELECTRICAL SPECIFICATION

Input:	+24V DC; 0.8A max
Output:	
HV pulse amplitude	Adjustable in HV_{MIN} to HV_{MAX} range (see How to order? section for the details)
HV basement level	0V, fixed
Pulse width	From 200ns to DC
Risetime / falltime	~10ns (10-90% level, warranted at load capacitance 11pF and below)
Jitter	± 10 ns (± 1 ns in LJ-modification)
Delay time	1 μ s (100ns in LJ-modification)
Repetition rate	Up to 100kHz (see Performance section for details)
Cooling:	Forced air cooling at high repetition rates
Environment	
Operation temperature	+10...+40 C
Storage temperature	-20...+60 C
Humidity	90%, non-condensing

MECHANICAL SPECIFICATION

Size (LxWxH)	130x80x25 mm
Weight	0,1 kg

DRAWINGS

How to order?

QBU-XXYY-ZZ, where

XX codes the maximal output voltage (V_{MAX} , user selectable up to 6000V), YY codes the minimal output voltage (V_{MIN} , 40% of V_{MAX}).

ZZ codes options:

LJ – low jitter option (mandatory for 6kV modification, optional for others) – jitter is as low as ± 1 ns, delay time is as short as 100ns;

Examples (the most popular modifications):

Part number	HV_{MAX}	HV_{MIN}
QBU-6024-LJ	6000V	2400V
QBU-5020 QBU-5020-LJ	5000V	2000V
QBU-4016 QBU-4016-LJ	4000V	1600V
QBU-3012 QBU-3012-LJ	3000V	1200V
QBU-2008 QBU-2008-LJ	2000V	800V
QBU-1004 QBU-1004-LJ	1000V	400V

Other modifications are available on request.

Performance

For continuous operation **with the appropriate cooling** we warrant the performance table as follows:

11 pF load capacitance								
Voltage, kV	2.0	2.5	3.0	3.5	4.0	4.5	5.0	6.0
Max. rep. rate, kHz	56	40	31	24	18	15	12	9

In the burst-mode (= short time operations) performance is increasing approximately twice and may achieve 100kHz value at low operating voltage and low load capacitance.

Higher load capacitance decreases the performance.

Note: modules with the higher performance are available on request

Typical output

QBU-6024-LJ, Capacitance load 11pF + HV Probe (about 13pF), 6kV pulses
