Innovative Software

By CadCam Technology Ltd

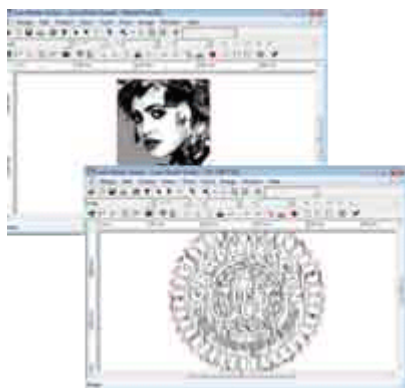

Laser Engraving Software

LMS

The Laser Marker Software (LMS) is combined with the Graphixscan Laser Engraving Systems.

The Laser Marker Software allows the output of images and the raster output of designs.

The software automatically converts a colour image to greyscale, scan lines are added for the path of the laser to follow. Assigning Material effects takes care of adjusting the speed and intensity of the laser marking. Within a design there is scope for 64 different levels of laser intensity.

Each design can be reproduced with precision every time. LMS gives the user total control of speed and power, which allows the GraphixScan to etch and cut to precise depths at lightning speeds.
