Product details

Specification parameter

Industry application

One type jewelry laser welding machine

The laser welding machine of jewelry makes use of laser deposition and welding, with laser high heat energy and concentrating fixed-point welding technology. The surface heat is diffused through the transmission, and the workpiece is melted by controlling the parameters of the width, energy, peak power and repetition frequency of the laser pulse to form a specially fixed molten pool. Because of its unique advantages, it is widely used in gold and silver jewelry processing and welding of small parts.

The characteristics of the laser welding machine for jewelry:

- 1. Energy, pulse width, frequency, light spot size and so on can be regulated in a large range to achieve a variety of welding effects, the heat affected area is small, and the product will not be deformed.
- 2.The ceramic concentrator has high corrosion resistance, high temperature resistance and high photoelectric conversion efficiency.
- 3.The advanced automatic shading system eliminates the irritation of eyes during working hours.
- 4.The welding depth is large and the welding is firm.
- 5.Full melting, no eye, no trace of repair.
- 6.With 24 hours continuous working ability, the whole machine has stable performance.

Application field of jewellery laser welding machine

It is widely used in precision machining of micro parts, jewelry, denture denture, communication products, hardware, clock, stainless steel, etc.
